THE

IMPROVED

PRACTICAL MEASURER.

THE

Improved
PRACTICAL MEASURER,

CONTAINING

TABLES

FOR THE

MEASUREMENT OF SUPERFICES AND SOLIDS,

WITH

APPROPRIATE RULES OF COMPUTATION;

CALCULATIONS OF THE DIMENSIONS OF CASKS;

AND A

COMPREHENSIVE DISCOUNT TABLE.

TO WHICH ARE ADDED,

Treatises

ON THE

GROWTH, PRESERVATION, AND PREPARATION, OF TIMBER,

INCLUDING

MR. FORSYTH'S COMPOSITION FOR THE CURE OF FRUIT AND FOREST TREES;

WITH

REMARKS, BY C. H. PARRY, M. D. OF BATH,

ON THE DECAY OF WOOD,

AND THE MEANS OF PREVENTING THE DRY ROT.

THE WHOLE DESIGNED FOR THE USE OF

MERCHANTS, PLANTERS, LANDED PROPRIETORS, AND SURVEYORS,

AS WELL AS FOR THE VARIOUS CLASSES OF

MECHANICS, SHIP-BUILDERS, MASONS, CARPENTERS, &c.

BY JAMES HAVILAND,

TIMBER-SURVEYOR, &c.

London:

PRINTED FOR, AND PUBLISHED BY,

STEEL AND GODDARD,

CHART-SELLERS (BY APPOINTMENT) TO THE HONOURABLE BOARDS OF ADMIRALTY, TRINITY-HOUSE, EAST-INDIA COMPANY, &c. AT THEIR NAVIGATION-WAREHOUSE, 70, CORNHILL, NEAR THE ROYAL-EXCHANGE.

1817.

PREFACE.

In submitting the present Work to the public, the author is aware that it will be judged and appreciated by comparison with others on the same subject already extant. It will be expected from him that he should not only equal but surpass the labours of his predecessors—that he should supply their omissions, avoid their faults, and improve upon their merits: how far he has answered these expectations it is not for him to decide. He has to observe, that the particular Work with which his own is to be considered as entering into competition is Hoppus's Book of Measurement. The errors in that Work are so numerous, as to create a mistrust of its general accuracy, and of course to defeat its main purpose. In the Tables which it contains, the cube only is given, and that by a reference to two separate Tables; in the present Work, the superficial measure and the cube are presented at one view, an advantage particularly desirable in the measurement of Mahogany, Marble, &c. In page 106 of Hoppus's Solid Measure, a piece of timber fourteen

feet in length and thirty-eight inches the quarter-girt, is stated to contain 148 feet, 4 inches, 8 parts; here the cube is only 140 feet, 4 inches, 8 parts, making a difference of eight solid feet. Similar instances of inaccuracy in various parts of HOPPUS's Work might be detected, by reference to the corresponding calculations here given.

Among the various additional articles which distinguish the present undertaking from the one above-mentioned, may be noticed the following:—

1. A Table of Board and Timber Measure, more perfect than any hitherto constructed, shewing the Squares to every quarter of an inch, between four and thirty-seven inches.

2. The manner of purchasing Deals of every description by the standard hundred, with their respective superficial contents, and the prices, from 3s. to 6s. the foot cube.

3. A Discount-Table, from $2\frac{1}{2}$ to 20 per cent. and from one penny to one thousand pounds.

4. A Treatise on the Growth and Preservation of Timber, in which are noticed the seasons for felling, barking, and preparing it for market, with the mode of making Charcoal.

5. Mr. FORSYTH's Composition for curing Diseases, Defects, and Injuries, in all kinds of Fruit and Forest

Trees, with the method of preparing the trees, and applying the composition.

6. A Scale of the Dimensions of Casks, from 2 to 1000 Gallons, with the length of stave and breadth of head to each; as also, of dry Casks, for particular quantities of merchandize.

7. Remarks, by C. H. Parry, M. D. of Bath, on the Decay of Wood, with various Recipes for preventing the Dry Rot.

The Work, it is hoped, will be found extensively useful to Merchants, Agriculturists, Planters, and Landed Proprietors in general, as well as in various branches of the mechanic Arts, particularly Ship-Building, Masonry, Architecture, and all its subservient operations, such as Glazing, Painting, Plastering, Flooring, &c. In the preparation, revisal, and correction, of every sheet of the Tables, the most unremitting pains have been taken; and the precaution has been adopted of auditing them in the presence of two or more experienced calculators, in order that even the slightest inaccuracy might be detected. To claim the merit of infallibility for any human labour would be too presumptuous; and, after all the care exercised in the present instance, it is necessary to bespeak the Reader's candour, and to assure him that the correction of any error that may possibly have been overlooked will be

thankfully received by the publishers for insertion in a future edition.

Of his qualifications for the present arduous undertaking, the only testimony which it becomes the author to adduce is the manner in which it is executed. He may be permitted to add, that, after an experience of forty-five years in the purchase and valuation of Timber, partly as a Contractor for the Navy, and latterly as a Surveyor to several eminent Landed Proprietors, he is enabled to define what should be the proper requisites of a work like the present, and may safely pretend to some portion of that practical knowledge which its execution demands.

THE

IMPROVED

PRACTICAL MEASURER.

OBSERVATIONS AND REMARKS

ON THE METHODS NOW USED FOR MEASURING TIMBER, AND RULES FOR COMPUTING THE CONTENTS.

TIMBER is generally distinguished into three sorts—square timber, thick stuff, and plank. By square timber is implied the full size of the tree as it grows, the sides being squared; by thick stuff is meant square timber cut into different thicknesses, from ten inches down to four inches and a half, but to the whole depth of the timber the reverse way; and plank is any division of timber, from four inches down to one inch and a half in thickness: all under that thickness is called board.

Oak, Elm, and Beech, timber, is always squared by the merchants before it is sent into the king's or other yards for the purpose of ship-building; and by their contract it must be so squared, that the sum of the breadth of the slabs taken off shall not be less than twice the sum of the wanes: if it be less, the king's measurers cause the upper sides to be pewed, until the dimensions are reduced to the terms before mentioned.

The timber being thus squared, its sides are measured each way with a pair of callipers, and these two squares being added together, half the sum is taken as a mean, which multiplied by itself, and that product by the length, produces the contents.

Ash timber is received into the king's yards unstripped of its bark, and is measured by taking its circumference with a cord or line; which circumference, divided by four, gives the girt: this girt is reckoned as the side of a square, the area of which is equal to a section of the tree at the place measured; therefore, the square of that girt, multiplied by the length, will give the contents.

All timber is bought and sold by the load, and a load is estimated at forty feet of unhewn or rough timber, and fifty feet of hewn timber, which is supposed to weigh one ton, or twenty hundred weight. For, it is argued, hewn timber is measured by the square, which measurement is very nearly exact, but rough timber is measured by the girt, or quarter compass, which is about one-fifth less than exact; therefore, in buying and selling of timber, the result is nearly the same, whether the measurement be by the girt, at forty feet solid per load, or exact, at fifty feet per load.

In the king's yards, forty feet of hewn timber are reckoned a ton, and fifty feet of such timber make a load.

Thick stuff and plank are always supplied from the merchant, sided to their various thicknesses, to which the timber is always cut in the wood or forest where it grows; and, when measured, the superficial contents only are taken.

This is done by measuring the breadth exactly in the middle, and multiplying that by the whole length: then, the number of superficial feet in a load, according to the thickness of the different plank or thick stuff, will be found in the following table.

Thickness of the thick stuff or plank	Inch. 10	Inches. 9	Inch. 8	Inches. 7	Inch. 6	Inch. 5	Inch. 4	Inch. 3	Inch. $2\frac{1}{2}$	Inch. 2	Inch. $1\frac{1}{2}$
No. of superficial feet to a load....	Feet. 60	Feet. 66.66	Feet. 75	Feet. 85.71	Feet. 100	Feet. 120	Feet. 150	Feet. 200	Feet. 240	Feet 300	Feet. 400

There are several other cases that occur in the measurement of timber for sale, all of which will be explained in the following examples:

First. To compute the solidity of round timber when the tree is straight and its ends equal or nearly so.

RULE. Multiply the square of one-fourth of the circumference by the length, and the product will be the solidity, or contents.

EXAMPLE. What are the solid contents of a tree whose circumference is 72 inches, and length 28 feet?

One-fourth of 72 inches is 1 foot 6 inches, which, multiplied by 1 foot 6 inches, makes 2 feet 3 inches, and this product, multiplied by 28 feet, gives 63 feet for the solidity.

Should the tree be crooked, then the length must be measured neither on the concave nor convex side, but in the middle.

Secondly. To compute the solidity of round timber when the tree tapers or is unequally thick.

RULE. Girt the tree in so many places as is thought necessary; then the sum of the several girts, divided by their number, will give a mean circumference, the fourth part of which being squared, and multiplied by the length, will give the solid contents.

EXAMPLE. A tapering tree, 24 feet in length, girts at four places as follows, what are its solid contents?

	F.	I.				
Girt 1st, ...	3	10				
2d, ...	4	6				
3d, ...	5	11				
4th,....	6	1				
Sum 4)	20	4	which, divided by 4,			
gives the mean compass	5	1	one-fourth part of which			
is equal to	1	3	3			
multiplied by	1	3	3			
makes	1	7	4	6	9	This square
multiplied by	24					
gives	38	9	1	the solidity.		

Thirdly. To compute the solidity of such trees as have their bark on.

In measuring such timber for sale, it is common to make an allowance to the buyer of one-twelfth part of the circumference on account of the bark, which will reduce the circumference to what it would be if the tree were stripped of its bark.

RULE. From the given circumference deduct its twelfth part for bark, and with the remaining compass find the solidity as before.

EXAMPLE. A tree with its bark, 40 feet long, girts 7 feet, what are its solid contents?

One-twelfth part of 7 feet is 7 inches, which deducted from 7 feet, leaves 6 feet 5 inches for the reduced circumference.

	F.	I.				
Then the circumference	6	5				divided by 4,
gives	1	7	3			the quarter compass,
multiplied by	1	7	3			
gives	2	6	10	6	9	which
multiplied by the length	40					
gives	102	11	6			for the solid contents.

Fourthly. To measure and compute the solidity of square timber, as received in the king's and other yards.

On account of the great irregularity in the growth of timber most useful in ship-building, the taking a mean of the several girts or dimensions, as before shewn, is not considered sufficiently accurate.

The method used in the king's and other yards is to measure the tree into so many lengths as shall be thought necessary, each length containing a part that tapers regularly. Then find the contents of each length separately, and, by adding the whole together, the contents will be obtained.

Branches or boughs measuring two feet in compass, or six inches girt, are reckoned as timber, and their solidity is computed

and added to that of the tree; but all parts of the trunk, boughs, or branches, that measure less than six inches, are not reckoned timber, and therefore are not added to the other contents.

RULE. The tree being marked into so many lengths, or parts, as are judged necessary, find the length of each part, and take the size of each upon the parts that are squared, both ways, and exactly in the middle of each length, or part; then multiply one square by the other, and that sum by its respective length, and the product will be the contents. Then add together the contents of every length so found, and the sum total will be the solid contents of the whole tree in feet; which divide by 50, and the quotient will give the number of loads contained therein.

EXAMPLE. Let the solid contents of a tree be required, whose dimensions are as follow:—First length 18 feet, its square 16 inches by 18; second length 12 feet, its square 14 inches by 12; third length 10 feet, its square 10 inches by 8: one branch 9 feet in length, its square 8 inches by 6; and another branch 8 feet in length, its square 9 inches by 7.

			Multiplied by		makes			Multiplied by	makes		
	F.	I.	F.	I.	F.	I.	P.	F.	F.	I.	P.
First,	1	4	1	6	2	0	0	18	36	0	0
Second,	1	2	1	0	1	2	0	12	14	0	0
Third,	0	10	0	8	0	6	8	10	5	6	8
Fourth,	0	8	0	6	0	4	0	9	3	0	0
Fifth,	0	9	0	7	0	5	3	8	3	6	0
								Solid contents of the tree	62	0	8

which, divided by 50, gives 1 load and 12 feet.

The calculation of the dimensions, as by the above rule, produces the exact contents of the tree, to the twelfth part of an inch; but it would be very tedious in measuring timber for sale or for receiving it into store. The measurers, therefore, generally use the sliding rule, with which they calculate much quicker, but no nearer than to the half of a foot, in the contents of each length;

but that is of little or no consequence, as the loss thereby would not exceed the odd inches in the before-mentioned tree. Having found the contents of each length by the sliding rule, add them together, as before, and their sum will be the solid contents of the tree.

To find the solid contents of each length by the sliding rule, say—as 12 on the girt is to the length on the slider, so is the mean square on the girt line to the contents on the slider.

Fifthly. To measure and compute the solidity of thick stuff and plank, as received into the king's and other yards.

Rule. Multiply the whole length of the plank by the breadth, taken exactly in the middle, and the product will be the superficial contents: then to find the solidity, or number of loads contained therein, look for the thickness of the plank, or thick stuff, in the foregoing table, under which will be found the divisor; then divide the solid contents in feet by 50, in order to give the solidity in loads.

Example I. Required the number of loads contained in ten inch thick stuff, length of which is 50 feet, and the breadth, taken in the middle, 1 foot 10 inches.

Fifty feet, multiplied by 1 foot 10 inches, is 91 feet 8 inches, which, divided by 60, is 1 load 31 feet 8 inches of ten inch plank, or 1 load 26 feet 4 inches 8 parts, the solidity required.

In the table of unequal parts, look for 10 inches thick, and 22 inches wide, and against 25 feet, the length, which, double, you will find 916 feet 8 inches superficial, and 76 feet 4 inches 8 parts, the solid contents.

Example II. There are fourteen two and a half inch planks, each measuring 28 feet in length, and 15 inches broad in the middle; required the number of loads contained in them.

Twenty-eight feet, multiplied by 15 inches, or 1 foot 3 inches, are 35 feet, which multiplied by 14, are 490 feet, divided by 240, is equal to 2 loads and 10 feet of two and a half inch plank, or 2 feet 1 inch cube.

Again, by the table of unequal parts, look for fifteen inches thick and 35 inches broad, and against 28 feet in the length you will find 1225 feet superficial, and 102 feet 1 inch cube, or 2 load 2 feet 1 inch.

By the sliding rule. As twelve on the slider is to the breadth on the rule, so is the length on the slider to the contents on the rule.

In the foregoing examples are contained all the cases that generally occur in the measuring of timber for sale; but when timber is regularly and smoothly hewn, the solidities of such pieces may be found to the twelfth part of an inch, by the following tables of square and unequal-sided timber.

Although the foregoing method of computing the solidity of round or unsquared timber, by the fourth part of the circumference, is commonly used on account of its ease, it is nevertheless very erroneous; for the fourth part of the circumference of a circle cannot be equal to the side of a square of equal area to that circle. Thus, if the circumference of a circle be 1, one of the sides of a square of equal area to that circle will be 0.2821; whereas, by the false method generally used, it will be but 0.25.

Now the solidity of a round tree may be found by either of the following rules:—

First. Multiply the square of the tree's compass by its length; that product, multiplied by .07958, will give its contents. Or,

Second. Multiply the square of the tree's compass by one twelfth of its length, and divide that product by 24; to the quotient add one tenth of itself, and subtract the sum from the former product, and the remainder will be the solidity.

Example. Suppose a tree to be 30 feet in length, whose compass is 5 feet 4 inches, what is its solidity?

By the first rule. Five feet 4 inches are equal to 5.333, the square of which is 28.440889; this square, multiplied by 30, gives 853.226670, which multiplied by .07958, gives 67.8998, or 67 feet and nearly 11 inches for the solidity.

By the second rule. The square of the compass, as found above, 28.440889, multiplied by one-twelfth of the length, 2.5, gives 71.1022225, which divided by 24, is equal to 2.9625926; one-tenth of this quotient, 2.962593 added thereto, makes 3.2588519, which subtracted from 71.1022225, leaves 67.8433706, or 67 feet and nearly 11 inches for the contents.

By the common rule. The fourth part of the girt is 1 foot 4 inches, and its square 1 foot 9 inches 4 parts, which multiplied by 30, gives 53 feet 4 inches for the solidity.

By each of the two first rules, the result is about 67 feet 11 inches, and by the common rule, only 53 feet 4 inches, making a difference of 14 feet 7 inches, which is too considerable to be disregarded.

To prove Gunter's line by the compasses, observe that the distance from $\left\{\begin{matrix}1 \text{ to } 2\\5 \text{ to } 10\\4 \text{ to } 8\end{matrix}\right\}$ is equal to the distance from $\left\{\begin{matrix}2 \text{ to } 4\\4 \text{ to } 8\\3 \text{ to } 6\end{matrix}\right\}$ &c. &c.

TO NUMBER ON GUNTER'S LINE.

Observe that the figures 1, 2, 3, 4, 5, 6, 7, 8, 9, sometimes signify themselves simply or alone; at other times 10, 20, 30, 40, &c.; again at other times 100, 200, 300, or 400, &c. &c.

To find a number on the line, as suppose 134: for the figure 1, account 1 on the line, and for 3, take 3 of the large divisions, and for 4 take 4 of the smaller divisions, and that is the point. Again, to find 750 on the line: for 7 take 7 on the line, for 50 take 5 of the great divisions, and that is the point.

MULTIPLICATION BY GUNTER'S LINE.

To multiply 5 by 7, set one foot of the compasses on 1, in the left-hand line, and extend the other to 5 upwards, or towards the right-hand, and with the same extent place one foot on 7, and the other will extend to 35.

DIVISION BY GUNTER'S LINE.

Divide 63 by 3, extend from 3 to 1 downwards, or towards the left-hand, and that extent will reach from 63 to 21.

EXAMPLE II. Divide £288 equally among 16 men. The extent from 16 to 1 downwards will reach from £288 to £18 for each man.

RULE OF THREE DIRECT.

EXAMPLE. If 5 bushels of wheat cost 90s. what will 40 bushels cost? Extend from 5 to 90 upwards, and that will reach from 40 to 720s. required.

THE USE IN BOARD MEASURE.

EXAMPLE. If a board be 9 inches broad, and 19 feet long, what are the contents? Extend from 12, the centre of a foot measure, to 9 downwards, that extent will reach from 19 to $14\frac{1}{4}$ feet, the contents required.

TIMBER MEASURE.

EXAMPLE. If a piece of timber be 24 inches square, and 8 feet long, what are its contents? Extend from 12, the centre, to 24 upwards, and that extent twice the same way will reach from 8 to 32 feet, the contents.

COGGESHALL'S SLIDING RULE.

This rule is framed three ways, sliding one by the other, as the glazier's rule—sliding on one side of a two-foot joint rule—and one part sliding on the other, in a foot of length, the back part being flat, on which are sundry lines and scales. Upon the aforesaid sliding side of the rule are four lines of numbers, three of which are double lines, and the other a single line, of numbers, marked A, B, C, and D. The three marked A, B, and C, are called double lines of numbers, and figured 1, 2, 3, 4, 5, 6, 7, 8, 9, then 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10, at the end: that marked D is the single line of numbers, and figured 4, 5, 6, 7, 8, 9, 10, 20, 30, and at the end 40, even with and under 10, in the double line next to it, and that is called the girt line, and so marked in the figure.

The girt line marked D is divided from 4 to 5 into 10 parts, and each tenth into 2 parts, and so on from 5 to 10; and then

from 10 to 20 it is divided into 10 parts, and each tenth into 4 parts, and so on all the way, from 20 to 40 at the end, which stands opposite to 10, at the end of the double line of numbers.

THE USE OF THE DOUBLE SCALE.

EXAMPLE. Suppose there is a geometrical square, whose sides are 3 feet and a half each. Set one on the line B, to $3\frac{1}{2}$ on the line A, and then against $3\frac{1}{2}$ on the line B is $12\frac{1}{4}$ on the line A, which is the contents of such a square.

Let the base of a triangle be 4 feet $1\frac{3}{4}$ inches, and the perpendicular 2 feet $1\frac{3}{4}$ inches; in the half of the one is 2 feet 7 parts, and in that of the other 1 foot 7 parts; set one on the line B to 4.15 on the line A, then against 1.07, half the perpendicular on the line B, is 4 feet, and almost half a foot for the contents. Or, if you set one on the line B is 4, and almost half a foot on the line A.

BOARD AND TIMBER MEASURE.

If upon a scale or rule one inch be divided into ten equal parts or primes, and again, by diagonals and parallel lines, each of them be subdivided into ten equal parts or seconds with the compasses, a more exact running measure may be taken for board and timber than by any other means whatsoever, and so place the same, or this table, if you will, upon any ruler. Also, by means of the columns of squares, may readily be found a square equal to any parallelopipedon, or piece of timber of which the thickness exceeds the breadth. For example: suppose a piece of timber to be 10 inches thick and 9 inches broad: multiply one side by the other, the product will be 90; seek in the column of squares for 90, which is found to stand against $9\frac{1}{2}$ inches, then on looking to the column of timber measure against $9\frac{1}{2}$, it will be found that 19 inches 2 primes in length will make 1 foot of timber, and 15 inches 1 prime and 6 seconds will make 1 foot of board.

A

TABLE OF BOARD AND TIMBER MEASURE,

MORE PERFECT THAN ANY HITHERTO CONSTRUCTED;

SHEWING ALSO THE SQUARES TO EVERY QUARTER OF AN INCH BETWEEN FOUR AND THIRTY-SEVEN INCHES.

A TABLE OF SCANTLING BY THE RUNNING FOOT.

Multiply the Square at the ends, and it will give the Superficial Inches.

EXAMPLE.—Required the Superficial Inches in a Piece of Scantling 5 Inches by 7 Inches.

Multiply 5 by 7; the produce, 35 Inches, is the Square of the end.

Look down the left hand column under Square Inches, until you come to 35, against which you will find, under 2s. a foot cube, 6d.; under 3s. 6d. a foot cube, $10\frac{1}{4}$d. the price given.

Square Inches.	2s. ℔ Foot.		2s. 6d. ℔ Foot.		3s. ℔ Foot.		3s. 6d. ℔ Foot.		4s. ℔ Foot.		4s. 6d. ℔ Foot.

TABLE OF ENGLISH MEASURES AND QUANTITIES,

RELATING TO BUILDING AND LAND.

Inch, one-twelfth of a Foot.
Palm, 3 Inches.
Hand, 4 Inches.
Span, 9 Inches, or a Quarter of a Yard, or Half a Cubit.
Foot, 12 Inches, or 3 Hands.
Square Foot, 144 square Inches.
Cubical Foot, 1728 cubical Inches.
Cubit, 4 Hands and a Half, or 1 Foot and a Half.
Yard, 36 Inches, or 2 Cubits.
Square Yard, 9 square Feet.
Cubical Yard, 27 cubical Feet.
Ell, 1 Yard and a Quarter, or 45 Inches.
Geometrical Space, 5 Feet.
Fathom, 6 Feet, or 2 Yards.
Square, 100 square Feet.
Statute-Pole, or Perch, or Rod, 16 Feet and a Half.
Chain, 4 Statute-Poles, or Perches, or 22 Yards.
Fen, or Woodland-Pole, or Perch, 18 Feet.
Forest-Pole, or Perch, 21 Feet.
Furlong, 40 Poles, or Perches, or 220 Yards.
Mile, 8 Furlongs, or 1760 Yards.
Square Statute-Pole, or Perch, $272\frac{1}{4}$ square Feet.
Square Woodland-Pole, or Perch, 234 square Feet.
Rood, 40 square Poles, or Perches.
Acre, 4 square Roods, or 160 Perches.
Load of rough Timber, 40 Feet.
Load of squared Timber, 50 Feet.

Load of 1 Inch Plank, 600 square Feet.
Load of 1½ Inch Plank, 400 square Feet.
Load of 2 Inch Plank, 300 square Feet.
Load of 2½ Inch Plank, 240 square Feet.
Load of 3 Inch Plank, 200 square Feet.
Load of 3½ Inch Plank, 170 square Feet.
Load of 4 Inch Plank, 150 square Feet.
Load of Statute Bricks, 500.
Load of Plain Tiles, 1000.
Load of Sand, 36 Bushels.
Hundred of Lime, 25 Bushels.
Hundred of Deals, 120.
Hundred of Nails, 120.
Thousand of Nails, 1200.
Ton of Iron, 2240 Pound Weight.
Fodder of Lead, 19 Hundred and a Half, or 2184 Pounds.
Hundred of Lead, 112 Pound Weight.
Table of Glass, 5 Feet, and 45 Tables is a Case; but of Newcastle Glass, 25 Tables is a Case.
Bundle of 4 Feet Oak-Heart Laths, 120, and 30 Bundles a Load.
Bundle of 5 Feet Oak-Heart Laths, 100, and 30 Bundles a Load.

N. B. Fir or Deal Laths are of diverse Lengths, as 3, 4, 5, and 6 Feet; but all of them are reduced to the Standard Length of 5 Feet; and so every Run of Bundles (each Bundle containing 100 Laths) is a Load, being equal to 30 Bundles of 5 Feet Laths.

EXAMPLES TO ILLUSTRATE THE TABLES

FOR MEASURING THE SQUARE AND UNEQUAL-SIDED TIMBER, &c.

REQUIRED the superficial and cube feet in 120 deck planks, each of them 36 feet long, 12 inches broad, and 3 inches thick.

Take 15 planks, 3 inches thick, which are 45 inches
4 do. 12 do. broad, do. 48 do.

60

Look for 45 inches thick at the head, under which you will find 48 inches wide, and against 36 feet in length, in the left-hand column, you will find—

Superficial feet.		Cube feet.	
6480	and	540	which is for 60 of them
double 6480	and	540	it will turn out
12960	and	1080	or 21 loads 30 feet.

Required the superficial and cube feet in a standard hundred of Russia deals, being 120 deals, 12 feet long, 11 inches wide, and $1\frac{1}{2}$ inches thick.

Take 30 of them, $1\frac{1}{2}$ inches thick, being 45 inches, and
4 do. 11 do. wide, do. 44 do.

120 deals

Look for 44 inches thick, being the lesser number at the head, under 45 inches wide, and against 12 feet, the length, in the left-hand column, you will find 1980 superficial feet, and 165 feet cube, or 3 loads 15 feet.

Required the superficial and cube feet in a standard hundred of Norway deals, being 120 deals, each deal 12 feet in length, 9 inches wide, and 3 inches thick.

Take 4 at 9 inches wide, are 36 inches
15 at 3 do. thick, are 45 do.

60

Look at the head for unequal-sided timber, for 36 inches thick, and under that for 45 inches wide; then look down the left-hand column for 24 feet, the length being double 12 (because only 60 deals are taken in thickness and width), you will find 3240 superficial feet, and 270 cube feet, or 5 loads 20 feet, the answer.

Required the solidity of the parallelopipedon, the length being 12 feet, the breadth 3 feet 6 inches, and the thickness 4 feet.

Look for unequal-sided timber, 42 inches thick and 48 inches wide, and against 12 feet in length you will find 168 feet.

Required the contents, in superficial and cube, whose length is 6 feet, its breadth $2\frac{1}{2}$ feet, and thickness $1\frac{3}{4}$ feet.

Look for 21 inches thick, and 30 inches wide, and against 6 feet in length you will find 315 superficial feet, and 26 feet 3 inches cube.

If a piece of timber be 9 inches thick, 25 inches broad, and 25 feet in length, how many superficial and solid feet are contained therein?

Look for 9 inches thick, and 25 inches wide; against 25 feet long you will find 468 feet 9 inches superficial, and 39 feet and 9 parts cube.

How many superficial and cube feet are in a block of marble, whose length is 3 feet 2 inches, breadth 2 feet 8 inches, and thickness 2 feet 6 inches?

Look for 30 inches thick, and 32 inches wide; against 3 feet long is—

	Superficial feet.			Cube feet.		
	240		and	20		
at the bottom, against 2 inches in length	13	4	and	1	1	4
	253	4		21	1	4

the answer.

Required the superficial and cube feet in a log of mahogany, whose length is 18 feet 6 inches, its breadth 20 inches, and thickness 9½ inches.

There being no half inches in thickness, double it, and say 19 inches thick, and under 20 inches broad look for 9 feet 3 inches.

	Superficial.		Cube.			
	F.	I.	F.	I.	P.	
The length against 9 feet is	285	0	23	9	0	
do. 3 inches is	7	11	0	7	11	
	292	11	24	4	11	the contents.

N. B. Whenever you double either the thickness or width, but not both, take half the length; if you double both, take one quarter of the length.

Pieces of timber						Superficial.			Cube.		
F.		I.		I.		F.	I.	P.	F.	I.	P.
32	in length,	6	thick, and	6½	wide	104	0	0	8	8	0

FLAT MEASURE.

EXPLANATION OF THE TABLE OF SUPERFICIAL, OR FLAT MEASURE.

1. The series of breadths in this Table commences at one and a half inch, and extends, by the progressive addition of half-an-inch, to twenty-four inches.

2. Each page is divided into seven distinct parts.

3. The first part, or column to the left hand, exhibits the several lengths, in Feet, from one to thirty; and the second part the Inches, from one, two, three, and six.

4. The six rows of figures in the larger columns on the right hand, marked above, *Feet*, *Inches*, and *Parts*, and below, *Inches*, *Parts*, and *Seconds*, denote the several contents in square Feet, Inches, Twelfth-Parts, and Seconds, answering to every Foot. The same remark applies to the Inches in the left-hand column.

EXAMPLE I.

Required the square feet contained in a board 15 Inches broad and 18 Feet long.

Look at the head of the columns for 15 Inches, the given breadth, and trace the left-hand column down to 18 Feet, the length, opposite to which will be found 22 Feet 6 Inches, the contents required.

EXAMPLE II.

Required the contents of a plank, 19 Feet 9 Inches long, and $23\frac{1}{2}$ Inches broad.

At the top of the table find $23\frac{1}{2}$ Inches, the breadth, then trace down the left-hand column for 19 Feet, the length, against which will be found 37 Feet 2 Inches 6 Parts: then look in like manner for 9 Inches, the additional length, and the result will be 1 Foot 5 Inches 7 Parts 6 Seconds; the two results added together will give the contents, 38 Feet 8 Inches 1 Part 6 Seconds, viz.

	F.	I.	P.	S.
19 Feet	37	2	6	0
9 Inches	1	5	7	6
	38	8	1	6

EXAMPLE III.

Required the square feet contained in a plank 21 Feet long and 29 Inches broad.

As the table extends only to 24 Inches of breadth, the operation for 29 Inches must be performed at twice:

	F.	I.	P.
21 Feet long by $14\frac{1}{2}$ Inches, the half breadth . . .	25	4	6
21 Feet long, add the other half breadth	25	4	6
	50	9	0
OR,			
21 Feet long by 20 Inches broad	35	0	0
21 Feet long by 9 Inches broad	15	9	0
	50	9	0

NOTE.

It will be observed, on reference to the preceding Discount-Table, that the principals, specified in the left-hand column of each page, are retained in each successive column of that page, with the respective discounts deducted, according to the several rates per cent. expressed at the heads of the columns.

For example, £2 : 0 : 0, subjected to a discount of $2\frac{1}{2}$ per cent. per annum, is reduced to £1 : 19 : 0; the same sum, a a discount of 5 per cent. per annum, £1 : 18 : 0; and thus in every other instance.

With this brief explanation, the use of the Table, it is hoped, will be readily and clearly understood.

ON TIMBER.

THE soil on which oak thrives best is that which is generally termed strong clay, free from stones—a strong loam mixed with sand stones, with a substratum of clay in places most continually moist, but never thoroughly or long wet, and in others for the most part dry. In the one, as the tree makes but slow progress towards perfection, its shoots being short and stocky, but clean, its period of existence is long—in the other, as it imbibes more moisture, its shoots are long and clean, its leaves are larger, and of a more lucid green, its bark wide, and the whole plant puts on a more vigorous appearance; such a tree being, as it were, forced, sooner arrives at perfection, and in about one hundred years begins to decay at top, its bark becomes hidebound and mossy, and every symptom of decline is manifest. This being a decay of nature, and not of disease, as soon as it is visible the tree should be cut; but a premature decay is often brought on by ignorance and wantonness—by the latter, in consequence of the propensity which the lower orders of people have for stealing firewood, in which diabolical work the inhabitants of whole villages and towns, of all ages and sexes, partake, though the mischief is mostly done by women. As soon as the trees have dropped their leaves, these people go, armed with bills, and cut and mangle all the branches within their reach, and seize another opportunity to bear them away.

The provident steward, woodman, or tenant, would, if they knew their duty, immediately amputate the remainder of the limb

close to the bole, leaving the wound cut as smooth and perpendicular as possible; to this he should apply Forsyth's composition, of which a recipe is given in the sequel, or else a plaster made with cow-droppings, some sifted loam free from stones, and as much chopped hay as, when properly incorporated, will make an adhesive plaster—the composition will be improved by the admixture of chamberley; when the plaster has been applied, let some fine sifted wood, or turf ashes, be sifted on, or thrown against it, until no more will stick; the whole being made quite smooth, will exclude the air, and heal up the wound.

The English oak is not subject to peculiar diseases, so as to endanger either the existence or the progress of the tree. Both young and old are sometimes attacked with the mildew, in hazy thick weather; and of late years the young shoots scarcely ever escape the frost in spring, which generally destroys them, and prevents the otherwise good crop of acorns. Some soils and situations are particularly favourable to ivy: this plant winds round the stem and branches, and by its twisting and compressive powers, as well as by extracting nourishment by means of its roots at the several joints, does incredible mischief.

The trees which grow in hospitable climates, and those, I apprehend, which are of a solid texture, and consequently which are capable of bearing the cold of successive winters, contain a very small proportion of watery liquids: the sap which circulates in these vessels is thick and viscous at all seasons, and can hardly be said to be fluid. Is there not the strongest reason to think that this was so contrived for the express purpose of preventing their being deprived of all their heat, and being killed by the cold during the winter? Since, therefore, the sap of trees becomes obviously more viscous as it descends on the approach of winter, from the condensing effect of cold; and, on the other hand, as the warmth of spring advances, the sap becomes more and more fluid—if that sap be checked by any sudden cold, it immediately condenses, and the young shoots and leaves being thus deprived of their usual support, sicken, and turn yellow, and the leaves curl and wither; by a con-

tinuance of this cold the footstalk separates from the branch, and the leaf falls to the ground. It is at some period of this check that the leaf becomes in a proper state for the insect to produce the galls that so often appear.

It is well known that the season for felling oak is generally confined to the spring, and to that particular period of it when the sap begins to flow. A series of very cold winds, or of hot weather, will stop the circulation, and the bark will no longer run, but with extreme labour and difficulty; this is, therefore, a period of great exertion on the part of the tan-flawers, who work a vast many hours, by task-work.

There is also a second season for felling oak timber, which, though contrary to Act of Parliament, 1st John, c. 20th, is nevertheless sometimes practised, especially when, from an untoward season, or the want of hands, the buyer has not been able to get all his trees down in due time, before the bark is set, and is at the same time under an engagement to clear off all the trees by a specified day, under the forfeiture of all such as may remain behind. In this case, the buyer waits for a period after Midsummer (from the 8th to the 14th of July), when the first growth being, as it were, fixed, by probably a partial stagnation of the sap, resumes its former, or makes a fresh circulation, and the bark, which about a fortnight before was firmly fixed, will, in a moist season particularly, again run with tolerable freedom.

The purchaser is at the expence of felling the timber, barking, and preparing it for market. The bark, after being run from the tree, is set up in lengths for some time to dry; it is then conveyed to some barn or out-building, where it is cut and hatched—that is, the moss and other refuse, such as the rough rind, &c. are shaved off; the bark is then cut into pieces of two, three, or more inches in length, packed into large hair bags, and sold to the tanners. At the mouth of each bag is a quantity shaved but not cut, and on one of these pieces is marked the weight of the contents of that bag. It is absolutely necessary that the bark should be kept dry, not only to preserve its tanning qualities, but for the sake of fair

dealing with the tanner, who buys by weight. Hatched bark is sold by the load of forty-five hundred weight; and if the bark is the produce of thriving young trees, it is more valuable—the quality of the bark, and the manner in which it is dressed, necessarily determine the price.

The tanners say that there is a law to prevent jobbers dealing in bark; if such there be, I have not been able to find it; but I think there does not seem to be any chance of successful monopoly for such men, while the tanners are rich, many of the timber dealers not so, and the loss in the weight of the bark is well known to all dealers. I do not think, however, that they have any idea of the extent of this loss; and therefore we find them invariably sending their bark to the tanners as fast almost as it can be got ready for sale.

A few years ago, the very best faggots were sold in many parts of the kingdom for fourteen shillings to eighteen shillings per hundred: they are now selling at twenty-six shillings, and of inferior quality. The same may be said of cord wood, which has risen of late years from fifteen shillings to twenty-four shillings. The rise in this article is owing to the great demand for charcoal. Every thing, therefore, that is not wanted for manufacturing purposes, is converted into what is called collier's ware; and in case of not selling for that, it is eagerly bought up by housekeepers in the neighbouring towns and villages.

The mode of burning it into charcoal is as follows:—When the wood is cut into faggots, it is brought to the place to be burnt, which is generally chosen in a low damp situation. The pile is then made in the following manner: the hole in the middle is filled with straw; wood and faggots are placed all round, to the diameter of twelve or fourteen feet; on the top is placed more straw, then more faggots are heaped upon the pile, in the same manner as in the foundation; the second hole is filled with straw, and the upper part of the pile made as before; over the hole is placed a layer of damp turf, dung, or mould, in order that the fire may smother, but not burn openly. The pile being thus arranged, the straw in the

lower hole is lighted, and it is carefully attended to during ignition, to keep the fire alive, and to give vent to the smoke, by a number of small holes pierced into the covering. If the wood intended to be burnt into charcoal consists in a great measure of oak or beech, as sometimes happens where timber has been felled, it is not made into faggots, but into cords, of sixteen feet and a quarter long, four feet high, and three feet broad. Eleven cords are put into a pile, which will require two days and two nights to burn. The expences may be thus calculated :—

	£.	s.	d.
50 Cord of wood . . . . . at 16s.	40	0	0
Burning 312 sacks of charcoal . . . . at 5d.	6	10	0
Carriage of do. . . . . at 4d.	5	4	0
Wear and tear of sacks, loading, and beer .	4	4	0
Wood-house for the burner, about	1	0	0
Carriage to London	10	0	0
Cr.	£.66	18	0
By 312 sacks of charcoal, 5 bushels each, at 5s. 5d.	84	10	0
Profit	£.17	12	0

Preparing the wood, and piling it, 3s. a cord.

Sixty sacks constitute a load; but our waggons, being generally drawn by five or six horses, and with nine-inch wheels, carry from eighty to one hundred or more sacks per load, according to the state of the roads and the nature of the country.

The best coal is made from the large wood of oak, chesnut, birch, ash, and beech; the next best is from alder, hazel, willow, and sallow; but the small of them are found to be soft for the purpose.

MR. FORSYTH'S COMPOSITION,

FOR CURING THE DISEASES, DEFECTS, AND INJURIES, IN ALL KINDS OF FRUIT AND FOREST TREES, AND THE METHOD OF PREPARING THE TREES, AND LAYING ON THE COMPOSITION.

TAKE one bushel of fresh cow-dung, half a bushel of lime-rubbish of old buildings (that from the ceiling of rooms is preferable), half a bushel of wood-ashes, and one-sixteenth part of a bushel of pit or river sand; the last three articles are to be sifted fine before they are mixed; then work them well together with a spade, and afterwards with a wooden beater, until the stuff is very smooth, like fine plaster used for the ceiling of rooms. The composition being made, care must be taken to prepare the tree properly for the application, by cutting away all the dead, decayed, and injured, part, till you come to the fresh sound wood, leaving the surface of the wood very smooth, and rounding off the edges of the bark with a draw-knife or other instrument, perfectly smooth, which must be particularly attended to; then lay on the plaster about one-eighth of an inch thick, all over the part where the wood or bark has been cut away, finishing off the edges as carefully as possible: then take a quantity of dry powder of wood-ashes, mixed with a sixth part of the same quantity of the ashes of burnt bones, put into a tin box with hol s in the top, and shake the powder on the surface of the plaster, till the whole is covered over with it, letting it remain for half an hour, to absorb the moisture; then apply more powder, rubbing it only gently with the hand, and repeating the application of the powder, till the whole plaster becomes a dry smooth surface: and, for trees cut down near the ground, to the dry powder just mentioned, an equal quantity of powder of alabaster must be added.

ON THE

DECAY OF WOOD,

AND THE MANNER OF PREVENTING IT.

BY C. H. PARRY, M. D. OF BATH.

Dr. Parry thinks, that in all cases the decay of timber is caused by the putrefactive process, and in what is improperly called the dry rot. The situations in which the dry rot takes place are on the interior doors, shelves, and partitions of wine bins, and all other wood-work in certain cellars; or beams and rafters of roofs of close passages, joists lying on or near the earth, wainscotting of large rooms little inhabited, in old, and especially in single houses, and in all places of a similar nature. Whenever the dry rot occurs, some circumstance prevents a free circulation of air, by which it happens, that any moisture deposited on the timber remains on its surface, or soaks into it, without being dried off by the air.

At all seasons the air contains a considerable quantity of water, which it deposits on every substance that is colder than it, as is made manifest by bringing a bottle of liquor from a cold cellar, or of water from a deep spring, into a warm room.

The effect of a cold substance in condensing vapour is also seen by breathing on a plate of metal or a looking-glass, colder than the heat of the breath. In cold weather, all the situations before mentioned, where dry rot occurs, are cooled to the same degree as the air in a little time; but when the weather grows warm, as they are covered from the rays of the sun, and receive no heat from fires, they remain at their former temperature, which being then much lower than that of the air, its moisture is deposited on them, as in the case of the cold bottle; and no ventilation or heat, either artificial or natural, occurring to remove the moisture, it remains unmoved, and receives fresh additions on

every similar change of temperature of the air: the lowest degree of heat at which putrefaction takes place is a little below 45° Fahrenheit, and the highest within the degree which produces dryness by evaporation. In the situations mentioned, the latter cause of prevention cannot take place, and the former very seldom can, except in frost of long continuance; hence they are most favourably disposed to promote putrefaction, and this sufficiently accounts for the decay of any timber placed in them. Some have supposed that the crop of mucor, or mould, and minute fungi, which is found on timber so decayed, is the actual cause of the dry rot; yet though they accelerate the rot by the damp which they attract and retain, they only appear in decayed wood, because it is their proper soil, and cannot be said, with more propriety, to be the cause of dry rot, than the white clover which appears on certain soils, after a top dressing of cold ashes, can be said to have produced the soil on which it flourished.

In wainscots, the outside surface, though unprotected by paint, will be long in rotting, because the room admits of currents of air, especially when the doors and windows are frequently opened, so as to evaporate the superficial moisture, though less quickly and effectually than in the open air; but on the surface next the wall, the air, in the narrow space between them, deposits its moisture by condensation, from the causes before stated; and as there is afterwards no current of air, nor sufficient heat to evaporate the water so deposited, it slowly decomposes and destroys the panel on that side.

It frequently happens in houses, especially in the country, that the walls become stained, and the paper separates, and hangs down in a perishing state. As this usually happens at the side or corner most exposed to the weather, it is concluded that the damp comes through the wall, and all means which can be thought of are used to prevent this penetration: these means sometimes succeed, but it often happens that casing, plastering, and painting, the devoted angle, totally fail, and then the real cause of the evil must evidently be the same as in the cases before stated—the

inner surface of the wall becomes of a very low temperature, by a long continuance of frost. While the internal air and the wall continue equally cold, or the wall is warmer than the air, no moisture will appear on it; but when the air becomes warmer than the wall, which it readily does from its great mobility, then the water which is mixed with it parts with its heat to the colder wall, and appears on its surface in drops, or pours down it in streams. This happens the more readily in proportion as the materials of the wall more completely fit it for conveying away heat from the vapours or water in the air, or, in other words, as it is a better conductor of heat, and the less porous its internal surface is; for this reason, a wall painted with oil colours condenses vapour sooner than one not painted. As a farther proof of the above assertions, walls surrounding staircases are always observed to be first covered with dampness, drops, or streamlets, of water; but these walls have no communication with the outside air, and, from their being generally painted, cannot admit of the passage of water through their pores.

The remedy for this evil is to prevent the walls from ever becoming colder than the warmest external air of winter; and this will prevent any damp from ever appearing on their inner surfaces.

The particular application of this rule is, that, in all single or detached houses, especially in situations exposed to high winds, the walls should be double, having on the inside a thin layer of brick, or a single brick partition, with an interval of one or two inches between them and the outside wall, to which it should be united by proper binders; the porous bricks and the confined stratum of air would so badly conduct heat, that such walls would necessarily tend to keep a house dry and warm in winter, and cool in summer: this end would be still more promoted, by filling the interval between the two walls with dry sand, fresh sifted coal ashes, or powdered charcoal.

It has been suggested, that it would be possible to keep the walls from being chilled by shutting up the rooms closely, and

thus preventing the admission of the cold external air; but besides that it would be impossible to prevent a circulation of air taking place in the rooms in some degree, it is evident, from the moisture being most abundantly, or perhaps solely, deposited on the inside of that part of the wall which is most exposed to the external cold, that the chief mode in which the wall is cooled is not by the access of the cold air into the room, but by the passage of heat from the wall itself into the cold air without. It will, however, be advantageous to exclude as much cold air as possible, by shutting up the windows and chimnies of uninhabited rooms during frost; but in all cases there is one method of preventing this species of dampness, which is infallible, and that is to keep every part of the internal surface of the wall sufficiently warm by good fires.

Water has another effect besides that already mentioned, in causing the decay of wood—it acts mechanically also, by penetrating into its pores, where it expands, by frost converting it into ice, and bursts the minute cells in which it was contained.

Timber felled in the spring is particularly liable to the dry rot. Dr. Darwin explains this fact, by telling us, that, in wood cut at this season, the sap in the alburnam is not only abundant, but of a saccharine quality, which, in combination with the vegeto-animal substance, or gluten, disposes it to run, with unusual readiness, into the destructive fermentation. Various means have been employed to remove the tendency to the dry rot in timber so felled: thus, it has been long exposed to the rain, or steeped, and even sometimes boiled, in water, and then dried by artificial heat. These means do not, however, appear to have been successful in entirely washing out the fermentable sap which makes it subject to the decay before treated of.

The first point in preventing the dry rot is certainly to choose timber felled in autumn or winter, and properly dried.

Next, where it is practicable, a current of air should be frequently made to pass along over part of the wood; this expedient seems to have been particularly attended to by the ingenious archi-

tects of our Gothic churches, who are said, with that view, to have left various openings in the walls, between the two roofs of those edifices; and a strong instance of its efficacy may be seen in the great duration of the roof of Westminster Hall. In order also to promote evaporation, a certain degree of heat, such as that of air heated by the sun or fire, should be from time to time applied, if possible. Cellars themselves ought to have some communication with the outward air, by means of windows and shutters, or trap-doors.

Lastly, the dry rot may, in all cases, be infallibly prevented, where it is practicable to cover the surface of the wood, properly dried, with a varnish which is impenetrable and indestructible by water. Dr. Parry tried a composition for this purpose with considerable success, which is much cheaper than common oil-paint, and of which he found the receipt in the second volume of the Memoirs of the Bath Society, page 114, printed in 1783. It is as follows:—melt twelve ounces of rosin in an iron pot, add three gallons of train-oil, and three or four rolls of brimstone; and when the rosin and brimstone are melted and become thin, add as much Spanish brown, red, or yellow, ochre, or any other colour required, first ground fine with some of the oil, as will give the whole a shade of the depth preferred; then lay it on with a brush, as hot and thin as possible; some days after the first coat is dried, give it a second: it will preserve plank for ages, and keep the weather from driving through brickwork. This composition was used by the doctor about thirty years ago, on some elm paling, with the sole alteration of using one or two coats of white paint, as the colouring substance, for the sake of appearance, and this paling appears now to be, in every part of it so covered, as sound as when first put up. The doctor supposes that bees-wax would be a useful addition to the composition, to prevent its cracking, and recommends it to be added to the other ingredients in the following proportion: rosin twelve ounces, roll brimstone eight ounces, bees-wax four ounces, cut into small bits, train-oil three gallons; frequently stir these together over the fire, and so soon as the solid parts are

dissolved, the composition is fit for use. A higher temperature given it might risk its catching fire, which it will always do when at the heat of 600° Farenheit, or its boiling point, although not in contact with any flame.

Dr. Parry takes into consideration several other of the usual materials for coating or varnishing wood, but the preceding is superior to any of them in cheapness and durability.

The effects of paint are chiefly owing to the oil. Several oils, as linseed, hempseed, walnut-oil, &c. become dry when thinly spread on any hard substance, and form an elastic varnish over it; the drying quality is much increased by boiling it with certain metallic oxids, especially those of lead generally; litharge, or sugar of lead, has the same effect.

Oil of turpentine is added to paint, to make it flow more freely from the brush, and dry more quickly; but from wood long exposed to the weather, painted with white-lead so prepared, the white-lead rubs off in powder.

Dr. Parry thinks other substances, as well as the usual pigments used with oil, may have the effect of enabling the oil to adhere more firmly to the wood, and serve to increase the thickness of the defensive covering; he recommends the trial of fine river sand for this purpose—if sea sand be used, it must be first well washed in fresh water. More than thirty years ago, the doctor tried the effect of charcoal dust with this view, which he was induced to do from observing the unalterable nature of charcoal, in the common temperature of the air, and the durability that posts acquire from having their lower extremities charred, before they are put into the ground. He first coated some new water shoots carefully with drying oil, and immediately after dredged them all over with a thick layer of charcoal, finely powdered, contained in a muslin bag. After two or three days, when the oil was thoroughly dried, and firmly retained the greatest part of the charcoal, what was loose was brushed off, and a coat of common lead-coloured paint applied, and a few days after a second coat—the whole became a solid and firm crust; the shoots were then put into their

places, and being examined many years afterwards, appeared perfectly sound.

The charcoal should be either fresh made for this use, or be heated again in close vessels, to expel the water, which it greedily attracts from the air, and which would prevent it from adhering so well to the oil.

The objection to drying oils is their expence, which renders them too dear for most outside work.

Pitch, applied to wood, melts by the sun, and runs off in drops, or adheres to every thing that touches it; and the united influence of air and water seems to make it brittle and powdery, like rosin.

The effect of sand in making pitch more durable was tried on the red-deal shingled roofs in the market at Bath, about twenty years ago: it was applied hot, mixed with Spanish brown, and hardened by having sand sifted over it with a sieve; notwithstanding which, it seems to have left the wood like unmixed pitch, and, though frequently renewed, has not prevented the necessity of various repairs. The original boards are now everywhere, more or less, in a state of decay.

Animal oils are much cheaper than drying oils: they acquire a drying quality by being mixed with rosin, brimstone, or bees-wax, and this forms the composition before mentioned.

When the composition described is to be used, the wood, before it is put together or erected, should receive two or three coats of it, and proper means should be taken to dry each thoroughly in succession; in most cases, what means of preservation are necessary for wood should be used at first, as it is seldom possible to renew them on fixed timber with any chance of benefit. Perhaps it might be useful to add charcoal powder, or fine sand, to this composition, as well as to drying oil.

The use of brimstone in the composition might be supposed to prevent vegetation of fungi, or mould; and oil of turpentine will certainly act as a poison on growing vegetables, and perhaps rosin may have the same property. The brimstone will at least have

the good effect of preventing the depredations of insects, which, though not so destructive here as the termites, or white ants, of Africa and Asia, yet often do considerable mischief to timber; a particular account of some instances of which may be met with in the fifth volume of the Transactions of the Linnæan Society.

It is reported, that in India, a ring of lord Dundonald's coal-tar, drawn on the floor, round boxes, and other furniture, will effectually preserve them, and their contents, from the depredations of the white ant.

Most insects are fond of sugar and mucilage, which appears to be the reason why wood, felled when it abounds with sap, is most liable to be penetrated by worms. In such cases, it might be well to wash the wood, previously to the use of the composition, with a strong decoction of coloquintida, or bitter apple, or with white hellebore, after which the wood must be completely dried before the application of the composition. All these preparations are extremely cheap, and are either destructive or offensive to insects, and therefore will probably be an effectual defence against their attacks.

The lime-paints, contrived by M. Ludicke, and by Cadet de Vaux, may in some situations be preferable to the composition above recommended, on account of their greater cheapness, and being more easily prepared: they are both said to be very durable, by their inventors, for inside work; at least they would probably resist damp sufficiently well. M. Ludicke's paint is composed of curds and lime: the curds are bruised well in a pot, with a spatula, and an equal quantity of lime, well quenched, and made thick enough with water to be kneaded, is added; the whole is stirred well together, and a white fluid is obtained, which may be applied easily as a varnish, and dries very speedily. Ochre, bole-armoniac, and all colours not liable to be injured by lime, may be mixed with it, according to the colour desired to be given to the wood. When two coats are given, the surface may be polished by a piece of woollen cloth, and it will become as bright as varnish.

Cadet de Vaux's paint is prepared by mixing six ounces of fresh slack lime, well sifted, and five pounds of Spanish white, with two (Paris) pints of skimmed milk, and six ounces of linseed-oil; sufficient milk is to be first mixed with the lime, to bring it to the consistence of cream; the oil is next to be put in by degrees, while the mixture is stirred with a wooden spatula, and then the Spanish white, with the rest of the milk, is to be added.

Compositions, which resist water so well that they are used for caulking the seams of ships and boats, are prepared from lime, and some other ingredients, in India and China. Doctor Anderson, in his Recreations, has given the composition of the Indian chunam, for covering walls; but that for the purpose mentioned is still unknown to the public, in this part of the world: it is very probable that a cheap coating for wood, impenetrable to water, might be prepared on the same principles; and if any of our readers knows the composition, he would do a public benefit by communicating it.

The thin internal wall, or brick partition, recommended by Dr. Parry, has long been in use for the purpose he mentions, of keeping the internal surfaces of rooms dry.

Much more mischief is done to wood by worms than is generally imagined; and often what is attributed to rottenness is the effect of their ravages, as may be easily proved by the minute perforations of the outside of decayed wood, through which they have passed, and the passages cut along it, in the direction of its fibres: they seldom penetrate through any paint prepared from lead, and therefore it would be useful to paint every wainscot up the inside, before it is put up, in order to preserve it from their attacks, as well as from the ill effects of damp, so well explained by Dr. Parry.

AN IMPORTANT

AND

NATIONAL WORK.

This Day are published,

In One large Volume Quarto, Price TEN GUINEAS in Boards, the Second Edition, elegantly printed on a superfine Wove Paper, and illustrated with a separate Volume of large Draughts and numerous smaller Engravings,

THE

ELEMENTS AND PRACTICE

OF

Naval ARCHITECTURE;

Developing, in a clear and familiar manner, the PRINCIPLES of the ART, both THEORETICAL and PRACTICAL; with all the requisite Instruction for CONSTRUCTING and COMPLETING a SHIP of EVERY CLASS, from the forming of the draught to the launching into the water.

In the Work is included a completely new, original, and extensive, set of *TABLES* of the *DIMENSIONS* of the most approved ship of EACH CLASS in the BRITISH NAVY, of the different species of MERCHANT-VESSELS of the most approved construction, and of numerous boats, &c. from the long-boat of a line-of-battle ship to a wherry.

The whole is illustrated with a great number of *ENGRAVINGS;* consisting, principally, of a CAPITAL SERIES of elegant and most accurate DRAUGHTS of DIFFERENT CLASSES of SHIPS and VESSELS, from a LINE-OF-BATTLE SHIP to a BOAT of the smallest description; with another series on the same grand scale, elucidating the principles of LAYING-OFF, &c.

THE LARGER ENGRAVINGS ARE,

1. SHEER-DRAUGHT, HALF-BREADTH, and BODY PLANS, of a ship of EIGHTY GUNS upon two decks, on a scale of nearly 1-4th of an inch to a foot.
2. DISPOSITION of the FRAME of the eighty-gun ship, on the same scale.
3. The PLANKING EXPANDED of the eighty-gun ship, on the same scale.
4. INBOARD-WORKS of the eighty-gun ship, on the same scale.
5. PLANS of the GUN-DECK and ORLOP of the eighty-gun ship, on the same scale.
6. PLANS of the UPPER-DECK, QUARTER-DECK, and FORECASTLE, of the eighty-gun ship, on the same scale.
7. Plans of a CAPSTAN and WINDLASS, on a scale of 3-4ths of an inch to a foot.
8. MIDSHIP-SECTIONS of a seventy-four gun ship and a frigate, with an improved method of framing the timbers, and the best methods of applying iron fastenings in the construction.
9. Sheer-draught, half-breadth and body-plans, of a forty-gun FRIGATE; with cradle, &c. complete for launching.
10. A SLOOP of war, of 18 guns, on the newest construction.
11. Sheer-draught, half-breadth plan, body-plan, and plan of the bulk-heads, of the DART and ARROW, sloops of war, on the construction invented by SAMUEL BENTHAM, Esq. Inspector-General of His Majesty's Naval Works.

12. Sheer-draught, half-breadth, and body-plans of the NEW BRIGS OF WAR, of 18 guns, on the plan of those constructed in the year 1804.
13. INBOARD-WORKS of the same.
14. PLANS of the DECK, lower deck, and platforms, of the same.
15. Sheer-draught, half-breadth, and body-plans, of HIS MAJESTY'S NEW YACHT, the ROYAL SOVEREIGN, launched in 1804.
16. Sheer-draught, &c. of the YACHT built for the Prince Royal of Denmark.
17. Plan of the interior of a FIRE-SHIP.
18. Plan of the interior of a BOMB-VESSEL.
19. A KING'S CUTTER, of 10 guns, with the figures and construction of SLIDING KEELS.
20. Sheer-draught, half-breadth, and body-plans, of an EAST INDIAMAN of 1257 tons, on a scale of nearly 1-4th of an inch to a foot.
21. Sheer-draught, half-breadth, and body-plans, of a MERCHANT-SHIP of 544 tons, on the same scale.
22. A BRIG COLLIER of improved construction, 170 tons.
23. A VIRGINIA-BUILT BOAT, of 158 tons, fitted for a Privateer.
24. A FAST-SAILING SCHOONER of BERMUDA, burden 83 tons.
25. A VIRGINIA PILOT-BOAT, of 53 tons.
26. A BERWICK SMACK, on the improved construction.
27. A LONDON TRADER, of 60 tons, particularly distinguished for her united qualities of capacity and velocity.
28. A SOUTHAMPTON HOY, of 13 tons, admired for the same qualities.
29. A Man-of-war's LONG-BOAT, on a large scale, exhibiting the principles of Whole-Moulding, &c.
30. A Man-of-war's LAUNCH, on a large scale.
31. A Man-of-war's PINNACE, on the same scale.
32. A Man-of-war's CUTTER, on the same scale.
33. A Man-of-war's YAWL, on the same scale.
34. A large WHERRY, on the same scale.
35. The NEW LIFE-BOAT, as constructed by Mr. GREATHEAD, on the same scale.
36. A WHALE-BOAT, on the same scale.
37. A DOVER GIG, or SWIFT ROWING-BOAT, on the same scale.
38. LAYING-OFF, plate 1, Fore-body and Moulds,
——————— 2. After-body.
——————— 3. Fore and after Cant-bodies.
——————— 4, Transoms.
——————— 5, Square Tuck, and Round-aft Tuck.
——————— 6, Hawse Pieces.
——————— 7, Harpins and several parts of the Head and Stern.
39. Plans, Elevations, and Sections, of the different Contrivances for fitting the Store-Rooms, &c. on the Orlop of an eighty-gun ship; shewing the method of fitting all Ships of the Line in future.

☞ The plates of Laying-off are all on the same Scale as the Draughts above-mentioned of the eighty-gun ship.

In a Country whose natural strength and greatest ornament is her Navy, it would be unnecessary to expatiate on the utility and value of this work. It is sufficient to say, that it comprises FULLY, both in THEORY and PRACTICE, all that can be required by the artist for a full and accurate knowledge of the art, both for the King's and for the Merchants' Service, from a first-rate ship to the smallest boat. The manuscript of the first edition was many years in a progressive state; during which period, every attention was paid, and every exertion made, to collect and combine all the modern improvements in the practical construction, with the correct theory, as investigated by actual experiments. The very erroneous ideas which have been so long entertained, both by the Learned and the Ignorant, on the subjects of the resistance of fluids and the mechanism of floating bodies, are hereby avoided; and the true theory permanently established, on principles which fix it beyond the risk of doubt and power of contradiction.

The Tables of Dimensions and Quantities, including all the Iron-work, &c. never before given to the public, and which are far more extensive and correct

than any others heretofore seen, have alone occupied, for a considerable period, the time and attention of several persons, who have devoted the fruits of a long experience to this purpose; and they will, consequently, be found particularly *valuable* to the *ship-builder* in the formation of his *estimates*, which may, by their means, be computed to an unexampled degree of accuracy.

The work commences with a much more full and accurate explanation of the Terms used in Ship-Building than has ever before appeared: comprehending also a variety of other useful information for the use of the artist. It then proceeds to treat of fluids, and comprises in this division, an interesting account of a great number of experiments which have been made for determining the resistance of floating bodies; especially of all those which were made under the directions of the Society instituted for the Improvement of Naval Architecture. The other branches of the science are then discussed in a regular progressive arrangement, in which are detailed, with the utmost precision and clearness, the methods of imparting to ships and vessels of every description all the most desirable qualities. Copious Instructions are then given for delineating the several draughts and plans of a ship; namely, the Sheer Draught, Half Breadth and Body Plans, Disposition of the Frame Timbers, Planking Expanded, Inboard-Works, Plans of the Decks, &c. Next follows, in the same perspicuous manner, a complete explanation of the methods of *Laying-off* all the parts of a ship on the Mould-loft-floor, with the Method of Construction by Whole Moulding, and practical directions for the actual Building, Launching, &c.

To the whole are added Miscellaneous Observations on Improvements and projected Improvements; including the explanation of a new method proposed for the Framing of Ships, and of the best mode of adopting iron fastenings in their construction; together with Observations upon Timber, and rules for its admeasurement and conversion.

In this work will therefore be found, detailed in an uniform and perspicuous style, all that can be required by the novice, for his instruction, and by the adept, for his practice, in this important art. And, as Gentlemen of the most extensive knowledge in the several departments have been consulted and employed in the different branches, the whole may be considered as the result of the united experience and talents of the most eminent naval architects of Britain.

Anxious to present the Work to the Public in a style adequate to its consequence and national importance, the Proprietors have spared no expense to give it every advantage which could be derived from the present improved state of the Arts. It is sufficient to say, that the Letter-press, and Tables of Dimensions, &c. are printed uniformly with "The Elements and Practice of Rigging and Seamanship," so as to form, with that work, a complete set for SHIP-BUILDING, RIGGING, SEAMANSHIP, and NAVAL TACTICS.

ADVERTISEMENT TO THE SECOND EDITION.

The Proprietors, in again presenting this Work to the public, are gratified in the opportunity of expressing the satisfaction which they have experienced from the general welcome reception of the first edition, and of the peculiar happiness which they have derived from the very numerous testimonials of approbation they have received from the most distinguished and respectable Naval Architects, generally and individually, in favour of the Treatise, the Draughts, and the Tables. Thus encouraged they have been induced to obtain, and have, consequently, added an additional Draught, exhibiting, on a large scale, the Plans, Elevations, and Sections, of the new Methods of fitting the Store-Rooms, &c. between the Gun-deck and Orlop of Ships of the Line, which are equally applicable to Frigates; as the latter are also to be fitted in future in a similar manner. This plate, doubtless, will be considered as a very valuable addition, inasmuch as it appears to have been the only one required to make the work complete to the present time.

Printed for and published by STEEL and GODDARD, Chart-Sellers to the Hon. Board of Admiralty, at their Navigation-Warehouse, 70, Cornhill, London, near the Royal Exchange (removed from Tower-Hill); where Merchants, Captains, Traders, and others, may be supplied with the most approved and correct Charts, Pilots, Books of Navigation and Commerce, Circles, Sextants, Quadrants, Telescopes, and all other Nautical Instruments.

N. B. A large Allowance upon Exportation Orders.

THIS DAY IS ALSO PUBLISHED, IN ONE VOLUME OCTAVO, HANDSOMELY PRINTED ON FINE WOVE PAPER,

THE

Shipwright's Vade Mecum;

OR, AN INTRODUCTION TO

THE PRINCIPLES AND PRACTICE

OF

Ship-Building;

Including Vulgar and Decimal Fractions, Practical Geometry, &c.

Illustrated with four large and accurate Draughts, viz.

1. Sheer-Draught, Half-Breadth, and Body Plans, of a 74-Gun Ship.
2. Sheer-Draught, &c. of a Merchant Ship of 330 Tons.
3. The Planking expanded, Midship-Section, and Deck, of the Merchant Ship.
4. The Inboard-Works of the same; with a draught of a Long-Boat, &c.

*** *This work may be considered as a proper companion or introduction to the former; and will, likewise, be found very acceptable to those who cannot make it convenient to purchase the larger work. But either is complete, according to its object, independent of the other; and both are calculated as well for the young beginner as for the more experienced artist.*

NAVAL ARTISTS

Are respectfully informed, that at STEEL & GODDARD'S Navigation-Warehouse, may in future be had COMPLETE SETS of

MOULDS, SWEEPS, BATTENS, SQUARES,

and all other Instruments used in the Construction of the various Draughts and Plans of Ships and Vessels, most accurately finished and handsomely fitted up in Mahogany Boxes.

The COMPLETE SET of DRAWING MOULDS, &c. consists of Five Squares; Four Straight Battens; Sixteen Elliptical Moulds, or Bats; Fifty-four Small Moulds, viz. Thirty-two small and Twenty-two larger; Twenty-two Sweeps of different Radii, as follow:

	Ft.	In.		Ft.	In.

A NEW CATALOGUE

OF THE LATEST AND MOST APPROVED

Pilots, Charts, Books on Navigation,

NAVAL SCIENCE, AND COMMERCE,

PUBLISHED AND SOLD, WHOLESALE, RETAIL, AND FOR EXPORTATION, BY

STEEL & GODDARD,

Chart-Sellers to the Admiralty, East-India Company, &c.

AT THEIR

NAVIGATION-WAREHOUSE, N° 70, CORNHILL, LONDON,

Near the ROYAL EXCHANGE; Removed from TOWER-HILL.

*** *Gentlemen, possessing Original Surveys, or Documents, and who are inclined to part with the Result of their Labours for the Benefit of the Nautical World, are respectfully informed, that, on Application to the Proprietors, they will be engraven with Elegance, Accuracy, and Expedition.—Any Hints or Communications, tending to the Improvement or Correction of Charts and Nautical Publications in general, will be thankfully received.*

CHARTS.

The Atlantic Ocean, Great Britain, and the Orkney and Shetland Isles, &c.

		£	s.	d.
1	THE Atlantic, or Western Ocean, exhibiting the Coasts of Europe, Africa, and America, from the sixty-second degree of North Latitude to the Equator; in which the principal Points have been laid down from the most decisive determinations, made by the most eminent and experienced Navigators, both British and Foreign; with an Analysis of the Dangers, and a Table of the Variation of the Compass.....	0	7	6
2	A Survey of the River Thames from London, and of the River Medway from Rochester to the Nore. Price 5s., or on canvas and rollers	0	10	6
3	As a companion to the above, the River Thames from London to Woolwich; exhibiting that part of the River, with the new docks, canals, &c. on a scale of 4 inches to 1 mile. Price 4s., or on canvas and rollers	0	9	6
4	The River Medway. Plain 2s. 6d., or coloured	0	3	0
5	All the Entrances to the River Thames, &c. on a large scale	0	4	0
6	A new Chart of the Downs and Margate Roads; on a large scale	0	4	0
7	A splendid and unrivalled Chart of the British Channel, on Mercator's Projection; whereon the positions of places have been laid down from new and accurate surveys, (particularly from the grand trigonometrical surveys made by the board of ordnance); together with the precise extent, formation, and quality, of the Bank of Soundings: embellished with numerous Views, and accompanied with separate Plans of the principal Harbours, and complete directions.....	0	14	0
8	The Straits of Dover, on a large scale	0	5	0
9	The East Coast of England, from Folkestone to Yarmouth, including all the Entrances of the River Thames, and a particular Plan of Harwich Harbour, on an enlarged scale; drawn from original surveys and most authentic materials, with views, on a large scale.....	0	7	6
10	The East Coast of Great Britain from Yarmouth to Buchanness, with particular plans of Boston and Lynn Deeps, Edinburgh Frith, the Rivers Humber, Tees, and Tyne, the Harbours of Whitby, Sunderland, Berwick, Montrose, Dundee, and Aberdeen, on an enlarged scale	0	10	6
11	The East Coast of England from Lowestoff to Cromer, on which are laid down Yarmouth Roads, from a survey by Admiral Knight; and Hasborough Gat, from a survey by Capt. Joseph Huddart, on a large scale	0	4	0
12	A new and accurate Trigonometrical Survey of Yarmouth Roads, by Mr. T. Fotheringhame, Master in the Royal Navy; on a large scale	0	4	0
13	Downie's East Coast of Scotland; on a large scale	0	6	0
14	Downie's Holy Island, Fern Islands, and the Staples.....	0	4	0
15	Downie's Edinburgh Frith, from Berwick to the Limekilns, and of the Tay, from the Bar to Dundee, on a large scale	0	4	0
16	Downie's Coast of Scotland, from St. Abb's Head to the Red Head	0	3	6
17	Buchanness to Farout Head, with the Islands of Orkney and Shetland	0	7	6
18	The Orkney Islands, with directions, on a large scale	0	7	6

19	The Lewis's, and whole Coast of Scotland, compiled and drawn from the most recent and accurate Surveys, on a large scale	0	8	6
20	The Shetland Islands, on a large scale	0	4	0
21	A new and accurate Chart of the St. George's and Bristol Channels, with particular Plans of the Entrances to Liverpool, the River Clyde, &c. and the Harbours of Dublin, Waterford, Lamlash, &c. on an enlarged scale. In which the positions of the principal Points are laid down from the Grand Trigonometrical Surveys, made under the direction of the Hon. Board of Ordnance; and considerably improved from recent surveys and observations; on a large scale, with directions	0	10	6
22	The Bristol Channel; on which the principal Points have been laid down from, and regulated by, the Grand Trigonometrical Surveys, with a particular Plan of Padstow Harbour; on a large scale	0	5	0
23	The North, West, and South, Coasts of Ireland, comprising the Coast from Wexford to Londonderry, on a large scale; with particular Plans of the River Shannon, Cork, and Waterford, on an enlarged scale; compiled and drawn from the most recent surveys, on a large scale	0	8	6
24	The N. E. Coast of Ireland, from Drogheda to the Skerries	0	7	6
25	The N. W. Coast of Ireland, from the Skerries to Balliconnel	0	7	6
26	The West Coast of Ireland, from Balliconnel to Slyne Head	0	7	6
27	The West Coast of Ireland, from Slyne Head to Kerry Head	0	7	6
28	The S. W. Coasts of Ireland, from Kerry Head to Kilmurry	0	7	6
29	A new Survey of Bear-Haven and Bantry-Harbour, in Bantry-Bay; with a view and sailing directions, by Admiral Knight, on a large scale	0	5	0
30	A new Survey of Cork Harbour, intended as a companion to the Chart of Bantry-Bay, by Admiral Knight; with views and directions	0	5	0
31	A new Chart from the Feroe, Orkney, and Shetland, Isles, to the Bay of Biscay, including England, Ireland, and Scotland, on 3 large sheets	0	10	6
	N. B. This is a useful Chart to Mariners who go North-about.			
32	A new Chart from Scotland to Barcelona, in the Mediterranean, on 3 large sheets; from the best and most recent authorities	0	10	6
33	The United Kingdom, or Chart of England, Ireland, and Scotland, with the Coasts of France, Spain, Portugal, and Bay of Biscay	0	14	0
34	The Coasts of Sussex, Hampshire, and Dorset, from the Owers to the Poole Harbour, including the Isle of Wight, the Roads of St. Helen's, and Spithead, the Passage of the Needles, &c. On a large scale	0	6	0
35	Portland Roads, including the Shambles, Weymouth, and West Bay, by Admiral Knight; on a large scale	0	4	0
36	Torbay, on a very large scale, surveyed by Mr. J. Dessiou	0	4	0
37	Plymouth Sound, on a very large scale, from a new survey	0	4	0
38	Mount's Bay, with the adjacent Coast; on a large scale	0	3	0
39	The principal Harbours in the Channel and French Coast, on a large scale	0	5	0
40	The Scilly Islands, with Appearances of the Land, &c.	0	3	0
41	The Islands of Guernsey, Jersey, and Alderney, &c.	0	4	0

The North Sea, Baltic, Gulf of Finland, Greenland, &c.

42	An improved Mercator's Chart of the North Sea, on which the Latitudes and Longitudes of the principal Points have been laid down from Astronomical Observations; and constructed with the most careful attention from the recent and valuable surveys of Admiral Knight, Mr. Murdoe Downie, of many experienced Masters and Pilots, and from the most authentic Danish, Dutch, and French, Documents; with directions	0	7	0
43	The North Sea, reduced from the above, by Adm. Knight	0	6	0
44	The Southern Part of the North Sea, comprehending the Eastern Coasts of England from Dungenness to Lynn Deeps, and the opposite Coasts of France and Holland, from Cape Grisnez to the Texel; on a large scale	0	7	6
45	The Coasts of Flanders and Holland, from Boulogne to Rotterdam and the Hague, including also the Downs and Entrances of the River Thames; on a very large scale, embellished with views	0	7	6
46	The Coast of Holland, from Schowen to the Texel	0	7	6
47	A beautiful and exact copy of a Survey of the Hondt, or Western Schelt, from the Sea to Antwerp; on a very large scale	0	10	6
48	The Coasts of Batavia and Germany, from the Texel to the River Hever; including the Rivers Elbe, Weser, Ems, and Eyder, with the Island of Heligoland; on an enlarged scale; from the most recent authorities	0	6	6
49	The Northern Coast of Norway, from Halten Island to Christiansand	0	5	0
50	The West Coast of Norway, from Christiansand to Stadland	0	5	0
51	Continuation from Stadland to Blom Island	0	5	0
52	Farther continuation from Blom Island to Stavanger	0	5	0
53	The Kattegat, from the actual surveys of P. de Lovenorn, Esq. F. R. D. S. &c. and improved from recent surveys; on a large scale	0	5	0

54	The Coasts of North and South Jutland; including the Sleeve and the South Coast of Norway, from the Naze to the Entrance of Christiana; on a large scale	0	5	0
55	The Sleeve, or Bay of Bohus, comprising the Coast from Gothenburg to Christiana; drawn from actual surveys made by order of the Government of Sweden; on a large scale	0	5	0
56	The Sound, from the Koll Point to Falsterbo Reef; compiled and drawn from the actual surveys made by order of the Governments of Sweden and Denmark; on a large scale	0	5	0
57	The Entrances to the Baltic, comprehending the Sound with the two Belts, and the Danish Islands, from the actual surveys of Admiral Nordenanker, and improved from the Danish-surveys; with a particular Chart of the Great Belt, on a large scale, from an actual survey	0	7	6
58	The Baltic, or East Sea; with particular plans of the principal Harbours, on an enlarged scale; compiled and drawn from the surveys made by order of the respective Governments of Sweden, Denmark, and Russia, and from the surveys and observations of several experienced Officers of the Royal Navy; accompanied with directions	0	7	6
59	The Gulf of Bothnia; compiled and drawn from the actual surveys made by order of the Government of Sweden; on a very large scale; embellished with numerous views	0	8	6
60	Particular Chart of Bornholm and the Eartholms, on a large scale	0	3	0
61	The Gulf of Finland to St. Petersburgh, compiled and drawn from the actual surveys made by order of the Swedish and Russian Governments, and considerably improved from recent surveys, with particular plans of the principal Harbours; on an enlarged scale	0	6	6
62	The Coast of Norway and the White Sea, with the principal Harbours, on an enlarged scale; compiled and drawn from the surveys made by order of the Danish and Russian Governments, on four sheets	0	10	6
63	England to the Coasts of Greenland, Davis's Straits, &c.	0	8	0
64	Peeters's Charts of the Fisheries of Greenland and Davis's Straits	0	12	0

France, Bay of Biscay, Spain, Portugal, and Mediterranean.

65	The Coast of France, from Calais to Ushant, compiled and drawn from the actual French surveys; on three large sheets, with particular plans of the principal Harbours, and embellished with views; on a large scale	0	10	6
66	The Bay of Biscay; with particular Plans of the principal Harbours; on an enlarged scale. Drawn from the French surveys, with Views	0	6	0
67	The South Coast of France, from L'Orient to Bourdeaux, including particular plans of the entrances to Nantes and Bourdeaux; on a large scale	0	6	0
68	The North Coast of Spain, from St. Jean de Luz to Cape Finisterre, on a very large scale; with particular plans of the principal Harbours, on an enlarged scale; with numerous views, and complete directions	0	10	6
69	The Coasts of Spain and Portugal, with particular plans of the principal Harbours, on an enlarged scale; compiled and drawn from the actual surveys made by order of the respective Governments of Spain and Portugal, and considerably improved from recent surveys; on a large scale	0	8	6
70	The Coasts of Spain and Portugal on one large sheet	0	5	0
71	France, Spain, and Portugal; including the Navigation from the British Channel to the Straits of Gibraltar; on two large sheets	0	7	6
72	A new and elegant Chart of the Mediterranean, with the Island of Malta, and several of the principal Harbours; on an enlarged scale, and embellished with views; compiled and drawn from the actual surveys of Don Vincente Tofino, made by order of the Spanish Government; and other Officers of extensive science and experience; with directions	0	10	6
73	The Coasts of Spain and Barbary, from Gibraltar to Cape Tetuan; particularly of the Bays of Ceuta and Tetuan, in which are pointed out the most advantageous places of victualling and watering a fleet; with directions; by Admiral Knight; on a large scale	0	5	0
74	The Southern Coast of Spain, from Cadiz to Cape de Palos, and the Northern Coast of Barbary, from Cape Spartel to Cape de Tenez; with a particular plan of the Harbour of Cadiz, from the surveys of Tofino	0	5	0
75	The East Coast of Spain, from Cape de Palos to Cape de Creux, with the Islands of Majorca, Minorca, Yviza, &c. from the surveys of Tofino	0	5	0
76	The Adriatic Sea, or Gulf of Venice; with particular Plans of the principal Harbours, by Giovani Grubas; on a large scale	0	5	0
77	The Road of Leghorn, by Mr. John Jackson, Master in the Royal Navy	0	4	0
78	The Black Sea, on a large scale, from the Russian surveys	0	6	0
79	The Harbour of Cadiz, on a large scale, from Tofino	0	10	6
80	River Tagus and Environs of Lisbon, from an actual survey	0	10	6
81	The Straits of Messina, on a large scale, from an actual survey	0	5	0
82	The Grecian Archipelago; on a large scale	0	5	0

Africa, and Islands adjacent.

83	The Coast of Africa, from Gibraltar to Cape Blanco	0	6	0
84	Cape Blanco to Cape Verd	0	2	6
85	Cape Verd to Sierra Leone	0	6	0
86	Sierra Leone to Formosa, including the Gold Coast	0	10	6
87	Formosa to Cape Negro	0	10	6
88	Sierra Leone to the Cape of Good Hope; on a large scale	0	10	6
89	A Survey of the River Congo, on a large scale	0	7	6
90	——————— River Sherbro, on a large scale	0	2	6
91	——————— Sierra Leone, on a large scale	0	2	6
92	The Island of Madeira, with the Desertas and Porto Santo Islands	0	12	0
93	The Island of St. Michael, on a large scale	0	8	0
94	The Western Islands; by M. Fleurieu and Don Vincente Tofino	0	4	0
95	The Madeira and Canary Islands; from the surveys made by order of the French Government, by M. le Chev. de Borda; on a large scale	0	4	0
96	The Cape Verd Islands; drawn from the best authorities	0	2	6

North America, from Labrador to the Gulf of Mexico.

97	The Coast of Labrador, from Sandwich Bay to Cape Charles	0	4	0
98	A new Chart of North America, from Cape Charles, on the Coast of Labrador, and the Straits of Belle-Isle to Cape Cod; including the Gulf and River of St. Lawrence, Newfoundland, the Grand Bank and Banks adjacent, Nova Scotia, Bay of Fundy, Halifax, &c. with directions	0	12	0
99	The Coast of North America, from Boston to Cape Hatteras; including New York, Rhode Island, the Delaware, and Chesapeake, &c. compiled from the most recent authorities, on a large scale, with directions	0	10	6
100	The Coast of North America, from Cape Hatteras to the Gulf of Florida; with particular plans of Cape Fear, Charleston, Port Royal, Savannah, &c.; from the most recent authorities; on a large scale, with directions	0	10	6
101	The Gulf of Florida, Bahama Islands, Windward Passage, the Island of Jamaica, Cuba, the Bay of Honduras, and Mosquito Shore; with directions	0	10	6
102	The Gulf Passage, or New Bahama Channel, exhibiting the direction and extent of the Gulf Stream, including the Bahama Islands; by Capt. J. Manderson, of the Royal Navy; on a large scale, with directions	0	7	6
103	The Island of Bermuda or Summer Island	0	3	0
104	The Isle of Newfoundland, with Plans of the Harbours	0	8	6
105	Eastern Coast of Labrador, from Cape Bluff to Belle-Isle	0	3	0
106	Southern Coast of Labrador, from Grand Point to Shecatica	0	3	0
107	The River St. Lawrence, on a large scale	0	12	0
108	The Gulf of St. Lawrence, by Thomas Wright, on a large scale	0	10	6
109	Nova Scotia and the Bay of Fundy	0	7	6
110	The Straits of Belle-Isle, on a large scale	0	4	0
111	Island of St. John, or Prince Edward's Island	0	4	6

West Indies, South America, and Pacific Ocean.

112	The Whole of the West Indies, including the Gulf of Mexico, compiled from the original surveys made by order of the Spanish Government, and the surveys of several Officers of the Royal Navy; on 4 sheets	0	12	0
113	The Windward or Caribbee Islands, compiled and drawn from the actual Spanish surveys, on a large scale	0	5	0
114	The Windward and Mona Passages, including the Islands of Jamaica and St. Domingo; drawn from the most recent surveys; on a large scale	0	7	6
115	A Survey of the Virgin Islands, by George King, Land Surveyor of those Islands; including the Island of St. Croix, with particular plans of the Harbours of Tortola and Christianitoed; on a large scale	0	7	6
